Contrary to common assumptions, plastic pallets achieve better results than their wooden counterparts from an ecological standpoint. The difference is even more clear if we compare our reusable containers with disposable packaging.

Thanks to the significantly longer service life of plastic pallets and reusable containers, they do not need to be replaced as often. This positive circumstance as well as the possibility to reduce the volume of these transport packaging (folding, collapsing & nesting) means fewer transports. In addition, it can be recycled more easily and is lighter weight. **All of these factors help significantly reduce emissions.**
